0 0

Pred. ŏ. is the number of results predicted by chance to have a

REF A T J

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                              sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone
                                                                       will be sequenced to completion. In the event that

On Nov 4, 1999 this sequence version replaced gi:6175114 location For further information about this sequence, including its location For further information about this sequence, including its location For further information about this sequence, visit our sequence and relationship to other sequences, please visit our sequence and relationship to other sequences, please visit our send email archive Web site (http://www.fruitfly.org/sequence/) or send email archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* to bdgp@fruitfly.berkeley.edu. All contigs in this sequence record is so including the sequence in this sequence record is a robitrary. Gaps between the contigs are represented as a runs of N, but the exact sizes of the gaps are unknown.

* runs of N, but the exact sizes of the finished sequence the record will be updated with the finished sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AC012649 80866 bp DNA linear HTG 04-NOV-1999 Drosophila melanogaster chromosome X clone BACR07N08 (D1121) RPCI-98 07.N.8 map 17D-17E strain Y; cn bw sp, *** SEQUENCING IN PROGRESS ***, 101 unordered pieces.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 sequencing vector: Plasmid; n/a; 100% of reads chemistry: Dye-terminator Blg Dye; 100% of reads Assembly program: Phrap; version 0.960731 consensus quality: 206755 bases at least Q40 consensus quality: 207261 bases at least Q30 consensus quality: 207461 bases at least Q20 consensus quality: 207461 bases at least Q20

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This chimeric repair vector (CRV) SC4 is used in comparative studies on CC the experimental use of a CRV SC1 designed to repair the mutation found CC in Sickle cell disease beta-globin and the beta-globin of a HSC. The CRV CC designed to repair the mutation contains a nucleic acid having at most CC one 3' end and one 5' end comprising a segment of unpaired bases (CC disposed. The unpaired bases separate the nucleic acid into a first CC strand and a second strand, comprising a first region and a second region comprising a first region and a second region comprising a first region and the first region having at least 15 nucleotides. Each nucleotide of the first region comprises at least 8 ribonucleotides, which care Watson-Crick paired to 2'-deoxynucleotides, which ribonucleotides form at least least one ribonucleotide segment of at least 3 ribonucleotides cand the sequence of the first or the second region is the sequence of a firagment of a wild-type allele of a human gene. The CRVs can be used for treating diseases. They can be used for treating, sickle cell cliebase, beta-thalassenia, familial hypercholesterolaemia, Gaucher
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best Loc

                                                                                                                                                                                                                                                                                           This sequence represents a nucleotide analogue of the invention, termed a chimeric mutational vector (CMV). This sequence is directed against the beta-globin gene. The CMVs (I) are for altering a gene in a cukaryotic cell, and comprise: (a) a first strand (S1) having at least 15 nucleotides (nt); at least 3 nuclease-resistant ribo-type nt (nt') and at least 3 contiguous ribo-type nt, the same as, or additional to, the nt'; and (b) a second strand (S2) in which the nt are Watson-Crick (WC) paired to the nt in S1. The contiguous ribo-type nt in S1 are WC-paired to to the nt in S1. The contiguous ribo-type nt is other than a C2'-0-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides 2'-O-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides C2'-0-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides C2'-C-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides C2'-C-methyl substituted nt. nt' are 2'-AX-nucleosides; 2'-AX-nucleosides C3'-AX-nucleosides; A = oxygen, fluoro, chloro or bromo; when A = O, C3 = hydrogen or 1-6C alkyl and R = 1-6C alkyl; when A is halo then R and C3 are absent. (I) are used to repair a disease-related mutation in human cells (e:g. those associated with Gaucher's disease, sickle-cell anaemia,
                                                                           Matches
                                                                                          Query Match
Best Local Similarity
                                                                                                                                                                                   thalassemia, familial hypercholesterolaemia, emphysema etc.). The chimeric mutation vectors are also used to inactivate specific genes, i.e. to generate transgenic ('knockout') animals or plants. They are used for biomedical research and for pharmaceutical production. Any eukaryotic gene of known sequence can be altered, by replacement, deletion or addition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide for altering a genomic sequence in eukaryotes - particularly for correcting disease-related mutation(s) and for production of transgenic animals and plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           misc_feature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes double-stranded oligonucleotides (I) containing fragments of wild-type human alleles. (I) are used to repair disease associated mutations in human cells. (I) are preferably used to treat sickle cell aneemia or thalassemia (mutations in the beta-globin gene, including the promoter region), or Gaucher's disease (mutations in the glucocarebrosidase gene), in haematopoietic cells. (I) may also be used to treat familial hypercholesterolaemia (mutations in the lowdensity lipoprotein receptor gene), emphysema (the alpha 1-anti-trypsin gene), haemophilia (the factor VIII gene) or Christmas disease (the factor IX gene), in hepatocytic cells. (I) provides repair of small genetic mutations. The present sequence represents an oligonucleotide
                                             Chimeric oligonucleotide; specific alteration; target sequence; intramolecular duplex stability; intermolecular duplex stability; intermolecular duplex stability; nuclease degradation; chemical stability; hydrolysis resistance; degradation resisitance; A-type helix formation; stable conformation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Double-stranded oligonucleotides with containing a human wild-type allele - useful for repairing mutations in human cells, particularly those causing sickle cell anaemia or thalassemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genome; genetic lesion; haematopoietic stem cell; hepatocyte; RNase; human wild type allele; mutation; sickle cell anaemia; thalassemia; Gauchar's disease; glucocerebrosidase gene; hypercholesterolaemia; emphysema; haemophilia; Christmas disease; ss.
                                                                                                                        Oligonucleotide used in the course of the invention.
                                                                                                                                                          04-DEC-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention provides chimeric oligonucleotides comprising a stem portion having one or more nucleotides selected from 2'-0-alkyl-ribonucleotides, 2'-allyl-ribonucleotides, 2'-halo-ribonucleotides, 2'-o-methoxyethyl-ribonucleotides, 2'-branching group-ribonucleotides, 2'-o-methoxyethyl-ribonucleotides, 2'-branching group-ribonucleotides, and one or more ribonucleotides or 2'-o-branching group-ribonucleotides, and one or more loop portions. The chimeric oligonucleotides may be used for introduction of specific alterations into target nucleic acid sequences located in living organisms. They have increased intramolecular and intermolecular ouplex stability, increased resistance to nuclease degradation and increased chemical stability, resistance to hydrolysis and degradation, as compared to known chimeric oligonucleotides. They have structures which induce intramolecular and intermolecular Artype helix formation. They have highly stable conformations, as measured by thermal melting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    one 3' end and one 5' end comprising a segment of unpaired bases disposed. The unpaired bases separate the nucleic acid into a first strand and a second strand, comprising a first region and a second region respectively, each region having at least 15 nucleotides. Each nucleotide of the first region is Watson-Crick paired to a nucleotide of the second region and the first region comprises at least 8 ribonucleotides, which are Watson-Crick paired to 2'-deoxynucleotides, which ribonucleotides form at least one ribonucleotide segment of at least 3 ribonucleotides and the sequence of the first or the second region is the sequence of a fragment of a wild-type allele of a human gene. The CRVs can be used for repairing genetic mutations in cells for re-introducing into a patient for treating diseases. They can be used for treating, sickle cell disease, beta-thalassemia, familial hypercholesterolaemia, Gaucher
                                                                                                     Chimeric mutational vector; alkaline phosphatase gene; gene repair; disease-related mutation; human; Gaucher's disease; sickle-cell ana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric nucleic acid repair vectors - used for treating diseases such as sickle cell disease, beta-thalassemia, Gaucher disease, hyper:cholesterolaemia, emphysema or haemophilia
                                                                                                                                                          Chimeric mutational vector SC3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This chimeric repair vector (CRV) SC3 is used in comparative studies on the experimental use of a CRV SC1 designed to repair the mutation found in Sickle cell disease beta-globin and the beta-globin of a HSC. The CRV designed to repair the mutation contains a nucleic acid having at most
                                                                                     thalassemia;
                                                                                                                                                                                            17-JUN-1998

CC This sequence represents a nucleotide analogue of the invention, termed a chimeric mutational vector (CMV). This sequence is directed against the continuous cell, and comprise: (a) a first strand (S1) having at least 15 cc eukaryotic cell, and comprise: (a) a first strand (S1) having at least 15 cc nucleotides (nt); at least 3 nuclease-resistant ribo-type nt (nt') and at least 3 contiguous ribo-type nt, the same as, or additional to, the nt'; cc and (b) a second strand (S2) in which the nt are Watson-Crick (WC) paired to the nt in S1. The contiguous ribo-type nt in S1 are WC-paired to cc 2'-deoxyribo-type nt, and at least one ribo-type nt is other than a cc 2'-o-methyl substituted nt. nt' are 2'-Ax-nucleosides; 2'-Ax-nucleosides or 2'-AR-nucleotides; A - oxygen, fluoro, chloro or bromo; when A = 0, cc X - hydrogen or 1-6c alkyl and R = 1-6c alkyl; when A is halo then R and cells (e.g. those associated with Gaucher's disease-related mutation in human cells (e.g. those associated with Gaucher's disease, sickle-cell anaemia, thalassemia, familial hypercholesterolaemia, emphysema etc.). The collineric mutation vectors are also used to inactivate specific genes, i.e. to generate transgenic ('knockout') animals or plants. They are also used for biomedical research and for pharmaceutical production. Any eukaryotic gene of known sequence can be altered, by replacement,

                                                                                                                                                                                                                                                                                                                                                                                                                                              containing fragments of wild-type human alleles. (I) are used to repair disease associated mutations in human cells. (I) are preferably used to treat sickle cell anaemia or thalassemia (mutations in the beta-globin gene, including the promoter region), or Gaucher's disease (mutations in the glucocerebrosidase gene), in haematopoietic cells. (I) may also be used to treat familial hypercholesterolemia (mutations in the low-density lipoprotein receptor gene), maniphysema (the alpha 1-anti-trypsin gene), haemophilia (the factor VIII gene) or Christmas disease (the factor IX gene), in hepatocytic cells. (I) provides repair of small genetic mutations. The present sequence represents an oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide SEQ ID NO:95
Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism SNP; cell differentiation; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Double-stranded oligonucleotides with containing a human wild-type allele - useful for repairing mutations in human cells, particularly those causing sickle cell anaemia or thalassemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cole-Strauss AD,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   05-AUG-1997;

methylation of a particular cytosine in a motif 5'-Cpg-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic CD NA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one commenter, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the classes of oligomers, the degree of methylation is calculated. The method classes of oligomers, the degree of methylation is calculated. The method the respective of the central nervous, cardiovascular, gastrointestinal and respiratory composition of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide composition status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method disclosure of the invention.

This invention describes a novel method for determining the degree of CC methylation of a particular cytosine in a motif 5'-CpG-3', present in a CC genomic sample of DNA. The sample is treated chemically to convert CC genomic Sample of DNA. The sample is treated chemically to convert CC CYtosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. CC The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) oligomers CC and the degree of hybridisation to both classes is determined from the clabel on the amplicon. From the ratio of labels hybridised to the two CC classes of oligomers, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders CC therapeutic particularly by detecting mutations or single nucleotide CC systems etc., particularly by detecting mutations or single nucleotide CC types and for investigating cell differentiation of cell or tissue CC types and for investigating cell differentiation. The method allows the CC methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the company of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-SEP-2000;

(I) have cytostatic activity and can be used in vaccine production. (I) can be used for stimulating and/or expanding T cells specific for a tumour protein on contact with the T cells. They are also useful for inhibiting the development of cancer in a patient. (I) can be mutant species primers for nucleic acid hybridisation, for preparing can be used in the diagnosis of a colon tumour.
                                                                                                                                                                                                                                                                                                           Human
                                                                                                                                                                                                                                                                                                                            07-JAN-2002 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-NOV-20
The invention relates to novel human polynucleotides (AAI99513-AAI99538) and the encoded proteins (AAM99915-AAM99934) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease,

                                                                                                                                   Treating or preventing a metabolic-related disease or disorder, ecobesity, impaired glucose tolerance, insulin resistance, Syndrome Type II diabetes, comprises administering Genset Metabolic Genes
                                                                                                                                                                                                                                                                                                        16-JAN-2001; 2001US-262235P.
                         The invention comprises the amino acid and coding sequences of six human genset metabolic genes (GMG-7A, GMG-7B, GMG-8, GMG-9, GMG-10 and GMG-11). The GMG DNA and protein sequences of the invention are useful for treating or preventing metabolic-related disorders, such as: obesity;

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis and/or activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diseases (e.g. cardiac insufficiency, coronary insufficiency or high blood pressure). The GMG DNA and protein sequences of the invention may also be used as insulin sensitisers - for improving insulin sensitivity in persons with non-insulin dependent diabetes mellitus. The present cDNA sequence encodes the human GMG-7A protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 2257 BP; 728 A; 522 C; 482 G; 525 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ភ្លួននេះ នេះ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                 The invention relates to polynucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, haematopolesis regulating activity and may be useful in the diagnosis and/or treatment of cancer lankamia narrows such the diagnosis and/or treatment of cancer lankamia narrows such that diagnosis and/or treatment of cancer lankamia narrows such that diagnosis and/or treatment of cancer lankamia narrows such that diagnosis and/or treatment of cancer lankamia narrows such that diagnosis and/or the diagnosis and diagnosis 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
